

## **ABSTRACT**

1           A firearm laser training system of the present invention includes a target having a  
2   plurality of zones, a laser transmitter assembly for projecting a laser beam, a sensing device  
3   and a processor. The sensing device scans the target to produce target images to detect laser  
4   beam or simulated projectile impact locations. The processor receives impact location  
5   information from the sensing device and processes the received information to evaluate user  
6   performance and to display evaluation information and an image of the target including  
7   indicia corresponding to the detected impact locations.
